# Interpolation 

Dr. Mihail

October 26, 2015

## Definitions

(1) Interpolation: method of constructing new data points from sampling or experimentation.

## Case study

## Spoze we have

| $\mathbf{x}$ | $\mathbf{f ( x )}$ |
| :---: | :---: |
| 0 | 0 |
| 1 | 0.8415 |
| 2 | 0.9093 |
| 3 | 0.1411 |
| 4 | -0.7568 |
| 5 | -0.9589 |
| 6 | -0.2794 |

## Case study

## Piecewise constant

## Case study

## Piecewise linear

## Case study

## Piecewise linear

Given two data points, say $\left(x_{a}, y_{a}\right)$ and $\left(x_{b}, y_{b}\right)$, the interpolant function is given by:

$$
y=y_{a}+\left(y_{b}-y_{a}\right) \frac{x-x_{a}}{x_{b}-x_{a}}
$$

## Case study

## Polynomial

$f(x)=$
$-0.0001521 x^{6}-0.003130 x^{5}+0.07321 x^{4}-0.3577 x^{3}+0.2255 x^{2}+0.9038 x$

## Other methods

## Interpolation Methods

- Piecewise polynomial
- Spline
- Barycentric coordinates for interpolating on a triangle or tetrahedron
- Gaussian process
- And others...

## 2D functions

## Extend concept to multivariate functions

## Bilinear interpolation

## Problem setting

Suppose you have a function $f(x, y)$. You know the value of that function for a limited number of points (e.g., 4 points). Your goal is to approximate the function at arbitrary points $(x, y)$.

## Bilinear interpolation

We first do linear interpolation along the X -axis:

$$
\begin{aligned}
& R_{1}=f\left(x, y_{1}\right) \approx \frac{x_{2}-x}{x_{2}-x_{1}} f\left(Q_{11}\right)+\frac{x-x_{1}}{x_{2}-x_{1}} f\left(Q_{21}\right) \\
& R_{2}=f\left(x, y_{2}\right) \approx \frac{x_{2}-x}{x_{2}-x_{1}} f\left(Q_{12}\right)+\frac{x-x_{1}}{x_{2}-x_{1}} f\left(Q_{22}\right)
\end{aligned}
$$

## Bilinear interpolation

We then do linear interpolation along the Y -axis:

$$
\begin{gathered}
f(x, y) \approx \frac{y_{2}-y}{y_{2}-y_{1}} f\left(x, y_{1}\right)+\frac{y-y_{1}}{y_{2}-y_{1}} f\left(x, y_{2}\right) \\
f(x, y) \approx \frac{1}{\left(x_{2}-x_{1}\right)\left(y_{2}-y_{1}\right)}\left(f\left(Q_{11}\right)\left(x_{2}-x\right)\left(y_{2}-y\right)+f\left(Q_{21}\right)\left(x-x_{1}\right)\left(y_{2}-y\right)+f\left(Q_{12}\right)\left(x_{2}-x\right)\left(y-y_{1}\right)+f\left(Q_{22}\right)\left(x-x_{1}\right)\left(y-y_{1}\right)\right)
\end{gathered}
$$
